Advancing Enteral Feeding Solutions

New Ready-to-Hang (RTH) Safety Screw Connector System

Abbott is introducing a new Safety Screw Connector System designed to help reduce the risk of potential misconnections.

Abbott will provide education and support materials for a seamless transition from our current spike system to the new Safety Screw Connector system for pre-filled RTH containers.

FOR ADDITIONAL SUPPORT, speak with your Abbott sales representative.

See reverse to learn how this change impacts your current system.
Current Piercing Pin Set will be phased out during 2012.

You will use the Transition Sets for a limited time (approx. 3 months).

NEW Safety Screw Connector System

The Transition Set replaces both the “No IV” cap and the NEW Safety Screw Cap until conversion to the Final System is completed.

The plow on the underside of the Transition Set cuts through the foil seal when securely tightened.

Unscrew either the “No IV” cap or the RTH Safety Screw Cap and replace with the Transition Set.

Important Safety Information for Enteral Feeding Sets:

• FOR ENTERAL USE ONLY – NOT FOR IV USE
• Assure that set is connected only to enteral feeding tube
• For single-patient use only
• See Individual Product Labeling for Directions for Use and Important Safety Information

IMPORTANT!
